

TECHNOLOGIES USED

A combination of modern AI, NLP and database technologies to build a secure, offline and intelligent document assistant.

Python

Core programming language used for entire development of the project.

Streamlit

Used to build the interactive web application and user interface.

Ollama

Enables running Large Language Models (LLMs) locally on system.

**Phi-3
Mini**

Phi-3 Mini

Lightweight LLM used to generate accurate and context-aware answers.

Sentence Transformers

Pre-trained embedding model used to convert text into high-quality vector embeddings.

ChromaDB

Vector database used to store embeddings and perform fast similarity search.

SQLite

Lightweight database used to store and manage chat history locally.

PyPDF & python-docx

Libraries used for extracting text from PDF and DOCX documents.

Text Files

Support for plain text (.txt) files as document input format.

NumPy

Used for efficient numerical operations and handling embeddings.

Pandas

Used for data manipulation and handling structured information.

OS / System

Works completely offline on Windows operating system.

All technologies work together

to provide an offline, secure, efficient and intelligent document question answering system.

100% Offline

No internet required.
Your data stays private and secure.
